

1. ABSTRACT

Freelancing:

- Freelancing means to work as an independent company rather than be employed by someone else.
- Essentially, a freelance job is one where a person works for themselves, rather than for a company. While freelancers do take on contract work for companies and organizations, they are ultimately self-employed.
- A freelancer is an independent labourer who earns wages on a per-job or per-task basis, typically for short-term work.

Pros of Freelancing:

- Flexibility
- Control of Workload
- Better work-life balance
- Independence
- Exposure

Cons of Freelancing:

- Lack of employee benefits
- Sporadic work
- Responsibility
- Isolation

The vision of this project is to create a freelancing platform where people are in control of their own employment opportunities part-time or full-time; and where anyone who needs any kind of job done can contact a suitably qualified person by looking at their profiles. This web application provides the privilege for anyone who logs in to the website to hire people to get a job done, however big or small, without the involvement of huge companies and middlemen. Hence, it provides a platform for people to state their field of interest and look for a small part-time job in that field. It provides a platform for all kinds of jobs on per-job or per-task basis.

2. PROPOSED SYSTEM

2.1 INTRODUCTION:

The project 'ExploreLancer' is a website aimed at developing a web application to provide an even greater freedom in freelancing for both job seekers and job givers, as it is open to all and anyone who wants any kind of job done can hire.

2.2 MOTIVATION:

Freelancing is something that is becoming more and more popular in the recent days as people are brave enough to break out of the system of stressful routine 9 to 5 jobs and find something that gives them job satisfaction. This way, people have control over their own workload and hence can ensure a better work-life balance. This type of work environment has become possible due to the rise of start-ups, millennials and their pursuit for a more flexible work schedule. The continuous development of technology has also been key for this shift to occur. Instead of going through the hassle of interviewing and recruiting someone new (and all that comes with it), companies can find consultants for each and every project they have. Even people who have a full-time job perform freelance when time allows it because it allows them to widen their horizons and get exposure to different fields they want to try. It is also beneficial to those people who want to move through different kinds of jobs to find the one that is right for them.

Hence, due to its growing popularity, we wanted to create a web application that makes this process more simplified and easier to use.

2.3 PROBLEM STATEMENT:

Website that allows job seekers to post a profile for people to see, and providing a way for other people to contact them when they need a job done.

2.4 OBJECTIVE:

The objective of this project is to provide an even greater freedom in freelancing for both job seekers and job givers, as it is open to all and anyone who wants any kind of job done can hire. It aims to make the process of hiring help much more simplified.

2.5 PROPOSED SYSTEM:

What the website does:

- Allows users to create profiles

- Allows employers to view the profiles and select someone based on their portfolio
- Allows employers to give feedback to the jobseekers

Working Procedure for job givers:

- Register yourself for the website.
- Select the required option to see the profiles.
- You can go through the various profiles available and select any profile of your choice.
- You will be able to see the details and can proceed further as per your need.

Working Procedure for job seekers:

- Register yourself for the website.
- Select the required option to upload your profile.
- In the Description section you can mention your classified field of work and other entities (such as experience or previous works).

2.6 APPLICATIONS:

- It avoids intermediate persons and makes mutual deals between job seekers and job givers.
- Customers can directly connect with the job seekers through their email or phone numbers as given in their profile.
- Anyone can easily access the website and can add, edit or delete their profile.
- It has a wide range of possibilities for future development.

3. EXISTING SYSTEM

In the beginning, people who wanted to freelance had to make manual or web-based portfolios and go from company to company looking for freelance jobs until they made a name for themselves. This process, predictably, was off-putting.

With the increasing popularity of freelancing, there are already many websites based on this concept. For example, the popular website 'LinkedIn'. LinkedIn is the world's largest professional network on the internet. It can be used to find the right job or internship and to connect and strengthen professional relationships. Though very effective, the process seems very complex for someone who has no knowledge about web. For example, suppose an 18-year old wants a part-time job as a restaurant help, to pay for his education. LinkedIn wouldn't be very suited to his needs.

The same is the problem with another popular freelancing website called 'Freelancer'. Freelancer is an online outsourcing platform that puts clients and businesses in contact with a global network of freelancers. Any member can post a project, whether a short or long-term job, and choose from skilled freelancers who offer bid proposals with rate quotes and time estimates for completing the work. This is also a very effective, but complex.

Most of the existing freelance websites are for high-end professionals and for employers who want a big project done. We want our website 'ExploreLancer' to be a mix of freelancing and looking for temporary, part-time jobs, and also the kind of short-term jobs that you do and get paid immediately. The website also aims at middle-end and low-end job seekers to find a temporary job when they need money or when they feel like diversifying their portfolio or trying new jobs.

Though the main aim of the project is to provide freelancers with opportunities to get a job and to simplify the process of freelancing, it is also used for small-scale temporary or part-time jobs.

For example, if a web developer with a full-time software job has a lot of free time which he wants to utilise, he can upload his profile, and if anyone who is starting a small-scale start-up business needs a website done, they can contact that person.

4. SYSTEM REQUIREMENTS

4.1 Functional:

- Create Profiles
- Display Profiles
- View Profiles

4.2 Non-Functional:

- **Availability:** The player should be available for any number users.
- **Reliability:** Information will be displayed without any disturbance.
- Cost of storage and maintenance should be affordable
- Ease of use should be high

4.3 Hardware Requirements:

- System : P IV or above.
- RAM : 2GB or above.
- Hard Disk : 10GB or above.
- Operating System : Windows & or above.

4.4 Software Requirements:

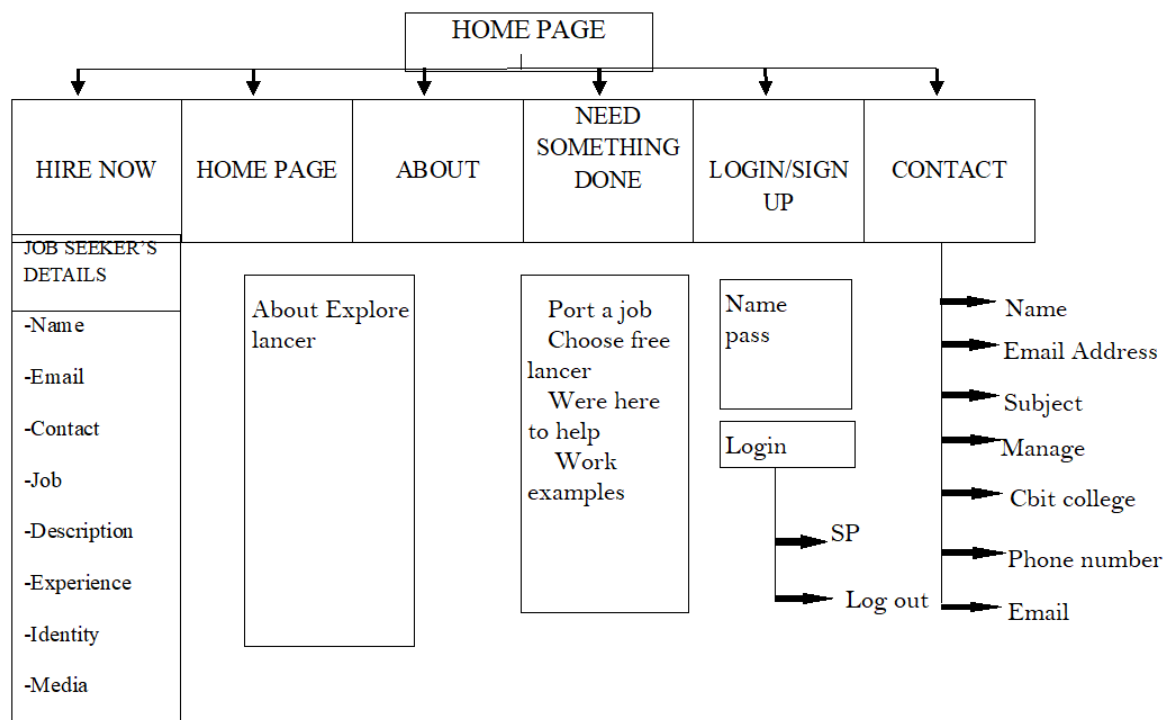

Languages used : HTML, CSS, JavaScript (front end development of the web pages and also for linking up of all the pages)

Back-end Development : PHP, Xampp Server with all default downloads (PhpMyAdmin, apache server, MySQL etc.)

5. METHODOLOGY

In the proposed system there are two categories of people, first are the job givers: who want to hire workers, second are the job seekers: who want to get hired by employers. Job seekers have to sign in or sign up for the website in order to post their details. Job givers don't need an account to access; they can simply search the profiles and proceed further according to their needs.

FLOWCHART:

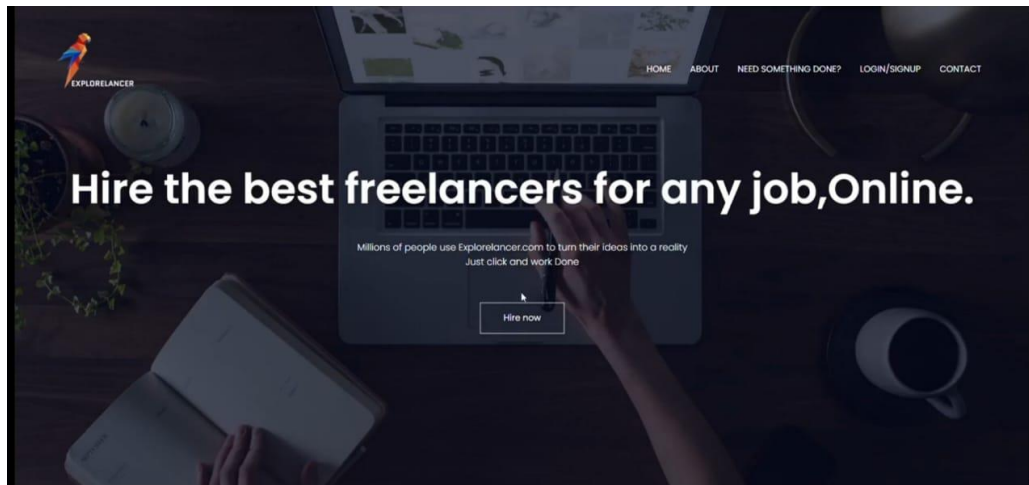

6. CODE

We have implemented the website in two sections; the front-end section and the back-end section. The front-end section contains the home page in which the links to all the other pages are included. In the back-end section, job seekers can give their details, job givers can view profiles and users can get help on how to use the website. Also users can send their message to us regarding any issue related to the website.

7. OUTPUT

Home Page: This is the main page from which all the other pages can be accessed.

9. FUTURE SCOPE

This current project is an extremely simplified version of what we want to do. This website has a lot of scope for future development.

The website can be divided into different sections for high-end, middle-end and low-end jobs and also based on different categories and work fields. There can be a wide range of categories available, categorising different work fields based on the duration of the job, categorising part-time jobs based on age and qualification of the job seeker and the pay they ask for. A search bar can be inserted to easily find the kind of person or job we are looking for. Profiles for regular job givers can also be added. There can be different features for each section. The profiles can either be made more descriptive and informative for creative jobs, or very simple for mundane jobs.

There can also be a real chat option between job seekers and job givers to make communication between them easier.

A responsive feedback section can also be added to validate a job seeker's commitment and talent. The feedback section can have star-based ratings and also a descriptive comment section to express people's views. A feedback section can also be made for the job giver, rating the treatment of his clients and the stress and circumstances provided. When a person searches for the job, the profiles available for that job can be displayed based on the ratings and reviews.

There can also be an availability of online payment from the job giver to the job seeker for easy transactions in case of jobs where the employer and employee do not actually have to meet.

With the changing mindsets of today's work force and the continuous development of technology, freelancing is going to be a major part of the future. Since in freelancing, most of the job transactions occur online, websites like this one are essential.
